AMENDMENTS

IN THE CLAIMS

Please amend the claims set to read as follows:

Claim 1 (currently amended): A process for autothermal catalytic steam reforming of hydrocarbons comprising preheating a reactant mixture of hydrocarbons, oxygen and water or water vapor to a preheating temperature, passing the preheated reactant mixture over a catalyst adiabatically and the catalyst has, the catalyst having a coating of a catalyst material on a carrier structure, the catalyst material containing at least one platinum group metal on an oxidic support material selected from the group consisting of aluminum oxide, silicon dioxide, or and mixed oxides thereof and zeolites.

Claim 2 (original): The process according to Claim 1, wherein said catalyst material further contains at least one oxide selected from the group consisting of boron oxide, bismuth oxide, gallium oxide, oxides of the alkali metals, oxides of the alkaline earth metals, oxides of the B group elements and oxides of the rare earth metals in a concentration of up to 40 wt.%, with respect to the total weight of catalyst material.

Claim 3 (original): The process according to Claim 1, wherein the catalyst material contains rhodium in a concentration of 0.1 to 2 wt.%, with respect to its total weight.

Claim 4 (original): The process according to Claim 3, wherein the catalyst material also contains platinum with a ratio by weight of rhodium to platinum of between 20:1 and 2:1.

Claim 5 (original): The process according to Claim 3, wherein said active aluminum oxide is the support material for rhodium and optionally platinum.

Claim 6 (original): The process according to Claim 4, wherein said active aluminum

oxide is the support material for rhodium and optionally platinum.

Claim 7 (original): The process according to Claim 5, wherein the catalyst material also

contains cerium oxide.

Claim 8 (original): The process according to Claim 6, wherein the catalyst material also

contains cerium oxide.

Claim 9 (original): The process according to Claim 7, wherein a monolithic honeycomb

structure made from ceramic or metal, open-cell ceramic or metal foam structures, metal

sheeting or irregularly shaped components is the carrier structures for the catalytic

coating.

Claim 10 (original): The process according to Claim 6, wherein a monolithic honeycomb

structure made from ceramic or metal, open-cell ceramic or metal foam structures, metal

sheeting or irregularly shaped components is the carrier structures for the catalytic

coating.

Claim 11 (original): The process according to Claim 9, wherein the reactant mixture

contains aliphatic or aromatic hydrocarbons or hydrocarbon mixtures.

Claim 12 (original): The process according to Claim 8, wherein the reactant mixture

contains aliphatic or aromatic hydrocarbons or hydrocarbon mixtures.

Claim 13 (original): The process according to Claim 11, wherein the air index λ of the

reactant mixture and its preheating temperature are chosen so that a temperature between

600 and 900°C is set at the outlet from the catalyst.

Claim 14 (original): The process according to Claim 12, wherein the air index λ of the reactant mixture and its preheating temperature are chosen so that a temperature between 600 and 900°C is set at the outlet from the catalyst.

Claim 15 (original): The process according to Claim 13, wherein a S/C ratio between 0.7 and 4 is set in the reactant mixture.

Claim 16 (original): The process according to Claim 14, wherein a S/C ratio between 0.7 and 4 is set in the reactant mixture.
